                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAB47496-500 show protein tyrosine phosphatase (PrPase) polypeptides. The PrPase polypeptides, or the cDNA encoding them, are useful for preventing, treating or ameliorating a medical condition in a mammalian subject. They are useful for diagnosing, preventing or treating on eneral disorders (e.g. Alzheimer's disease, preventing or treating neural disorders (e.g. Alzheimer's disease, carthritis, Grave's disease), immune system disorder; reproductive constitutes, forave's diseases, muscular disorder, reproductive considers, pulmonary disorders, cardiovascular disorders (e.g. arrhythmias), infectious diseases (e.g. viral hepatitis), considers (e.g. multiple sclerosis), endocrine disorders (e.g. diabetes consilitus), and wound healing and epithelial cell proliferation. They are also useful for preventing hair loss, to prevent skin aging consummalian characteristics, to treat weight disorders, to change a commamalian characteristics, to treat weight disorders, to change a researcy to change a treatment or physical state, or as a food additive or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The present sequence is human protein phosphatase (PP)-4.

C PP polynucleotide and polypeptide are useful in the diagnosis, treatment and prevention of immune system disorders, neurological contents, developmental disorders and cell proliferative disorders.

C Examples of immune system disorders and cell proliferative disorders.

C syndrome (AIDS), severe combined immunodeficiency disease (SCID), contents, athma, atherosclerosis, crohn's disease, amyloidosis, anaemia, asthma, atherosclerosis, crohn's disease, atopic comparativis, diabetes mellitus, emphysema, Goodpasture's syndrome, gout, contents, system selfitus, emphysema, goodpasture's syndrome, gout, contents, systemic sclerosis, myasthenia gravis, myocardial or pericardial inflammation, osteoarthitis, osteoporosis, panoreatitis, constitution, systemic disease, dementia, epilepsy, seriodic paralysis, mental retardation and other developmental contents, systemic system such as Down's syndrome, cerebral contents, periodic paralysis, mental disorders including mood, anxiety, cataly, periodic paralysis, mental disorders including mood, anxiety, cataly, periodic paralysis, mental disorders including mood, anxiety, cataly, periodic paralysis, mental disorders including mood, anxiety, catalysis, mental disorders including mood, anxiety, catalysis, mental disorders including mood, anxiety, catalysis, catalysis, developmental disorders catalysis, periodic paralysis, catalysis, bepatitis, cell proliferative concerting moodial dysgenesis, hypothyroidism, cell proliferative concerting adenocarcinoma, leukaemia, the polypeptide and concerting knockin humanised and for analysing proteome of a tissue or cell type, for screening an agonist/antagonist, a compound that concerting knockin humanised animals (piss) or transgenic animals (conference or ats) to model human disease, for generating a transcript image of a tissue or cell type, which represents the global pattern of gene

                                                                                                                                                                                              The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, compolymerase chain reaction (PCR) primers, oligomers, and for chromosome compolymerase chain reaction (PCR) primers, oligomers, and for chromosome compolymerase chain reaction (PCR) primers, oligomers, and for chromosome compolymerase chain reaction of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques compolyment (II) is useful for treat disease states involving components. (II) and its binding partners are useful for treating or quantitating a polypeptide in tissue, as molecular weight markers and as imaging of sites expressing (II). (I) and (II) are useful for treating composition of sites expressing (II). (I) and (II) are useful for treating composition of sites expressing (II). (I) and (II) are useful for treating composition of produce other types of data and produces have applications in the polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications compositions of genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and composition acid sequences. ABG00010-ABG30377 represent novel human composition and sequences of the invention.

Note: The sequence data for this patent did not appear in the printed composition in the printed and for which inhalmences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 3

                                                                                                                                                                The present invention describes isolated, enriched or purified nucleic carids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The present sequence represents mouse PTP05. The above proteins, other than CC ALK-7, are protein tyrosine phosphatases (PTP9) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat CC or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia CC pathways that involve the proteins, particularly cancer (e.g. leukaemia CC exine/threonine kinase) are used to promote neuronal survival, CC diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in cc gene therapy (optionally after mutation). Ab are used to determine the

The present invention describes isolated, enriched or purified nucleic CC acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The CC present sequence represents mouse PTP05. The above proteins, other than CC ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify CC substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat CC or prevent diseases associated with abnormal signal transduction CC pathways that involve the proteins, particularly cancer (e.g. leukaemia CC and lymphoma), while modulators of ALK-7 (which is a type I receptor CC serine/threonine kinase) are used to promote neuronal survival, CC diseases. Nucleic acid fragments of the polynucleotides encoding the CC proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in CC gene therapy (optionally after mutation). Ab are used to determine the CC proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20-MAY-1997;

                                                                                                                                                                                                                              The present sequence represents mouse protein tyrosine phosphatase (PTPepsilon) protein. The DNA encoding this protein is useful for the production of the recombinant protein, which is a protein tyrosine phosphatase which may be involved in the growth and differentiation of osteoblasts and brain cells and is useful for identifying compounds that modulate PTP-OB activity and as a therapeutic agent for treating
        Mouse protein tyrosine phosphatase mPTPepsilon

A recombinant host cell transfected or transformed with a nucleic acid vector comprising the nucleic acid can be used for the production of the PTB-OB protein. The protein can be used to screen for modulators of PTP-OB activity, which might be useful for treating e.g. osteoporosis and cancer. The present sequence represents a mouse mPTPepsilon polypeptide sequence

The PTP-OB nucleic acid and protein sequences were used in a method to identify a compound able to modulate PTP-OB activity, involving contacting a recombinant polypeptide comprising the entire cytoplasmic domain of PTP-OB with the compound, and measuring the ability of the compound to modulate the activity are useful in treating disease states involving PTP-OB activity such as osteoporosis, for preventing and treating bone loss, and stimulation of bone formation. The compounds are also useful for treating diseases in which activation or inactivation of PTP-OB protein results in either cellular proliferation, cell death, nonproliferation, induction of cellular neoplastic transformations or metastatic tumour growth, such as cancer, preferably lung cancer or

                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a cypregroup in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition improving drugs or therapeutics for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.

These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess bloddiversity and for nutritional purposes. The present sequence is a

                                                                                                                                                                                                                                                           immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypoptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activiny chamotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

                                                                                                                                                                                The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathles and central nervous system disease, such as lateral sclerosis, and sistemate, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and constraints.
                                                                                                                                    Sequence
                                                                                                                                                          specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-AUG-2000;

A cDNA clone encoding this sequence was used as a probe to isolate a clone encoding this sequence was used as a probe to isolate a clone gries of overlapping human cDNA clones defining the human MIPTP cequivalent, SH-PTP1, which contains two tandem SH2 domains. A clone given as ART35306 is used as a probe to detect a chromosome clone given as ART35306 is used as a probe to detect a chromosome clone given as ART35306 is used as a probe to detect a chromosome clone given as ART35306 is used as a probe to detect a chromosome clone given as a conding for the two tandem SH2 domains (see ARR99312). Confide the region coding for the two tandem SH2 domains (see ARR99312). Consplay a coding for the two tandem SH2 domains (see ARR99312). Complay it is indicative of an abnormality, normally associated with complay also be used to diagnose a condition or susceptibility to a condition associated with chromosome 12p abnormalities. Alternatively condition associated with chromosome 12p abnormalities. Alternatively comparison to sequenced PTP genes taken from a patient, where condition and altered by mutation to effect a change in megakaryocyte function and home condition.

                                                                    밁
                                                                                                                                                                                                            AAR99316 is a variant SH-PTP1 (protein tyrosine phosphatase-1, with two SH2 domains) obtained from a human erythroleukaemia cell line. The variant cDNA sequence (see AAR35310) lacks a sequence of two conclectides, AG, corresponding to positions 1868 and 1869 of the corresponding to the two tapes as a probe to detect a corresponding to the two tandem SH2 domains (see AAR99312). CC if the region coding for the two tandem SH2 domains (see AAR99312). CC if the probe will not hybridise DNA of chromosome 12p13 from a patient complasia. Alternatively the wild-type SH-PTP1 or SH-PTP2 gene or corporation may be used for comparison to sequenced PTP genes taken from a CC patient, where differences indicate an abnormality. The activity of CC SH-PTP1 may also be purposely altered by mutation to effect a change corporation.
                                                                                                                                    Query Match 23.3%;

humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
During sequence assembly data is compared from overlapping clones
Where differences are found these are annotated as variations
variation annotation may not be found in the sequence submission
only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all
chemistry or covered by high quality data (i.e., phred quality --
as compressions and repeats; all regions were covered by high quality data (i.e., phred quality --
as compressions and repeats; all regions were covered by at least
assembly was confirmed by restriction digest. The following
in the feature table with their source databases: Em., EMBL; Sw.;
database can be found at

                                                                                                                                                                                                                                                                                                                                                                   IMPORTANT: This sequence is not the entire insert of clone RP11-164N7 It may be shorter because we sequence overlapping sections only once, except for a short overlap. The true left end of clone RP11-164N7 is at 1 in this sequence. true left end of clone RP11-13E1 is at 101738 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr10

RPII-164N7 is from the library RPCI-II.1 constructed by the group of Pieter de Jong. For further details see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1132 GGAGCAGTATCACTTTTGTTACGATATTGTGCT 1164
